

The Sanctuary

by ecoTECH design studio

ecoTEC Living

has created modular, healthy, affordable and an environmentally sustainable housing solutions for people suffering MCS (Multiple Chemical Sensitivities), and those concerned with living in the healthiest environments. It is the beginning of a “new standard” for healthy housing in the global construction industry that includes single family and multi family housing, as well as commercial applications. The homes address the needs of the MCS community, and individuals with environmental concerns for allergies, air quality issues, and electromagnetic fields (EMF).

The team at ecoTECH design studio consists of LEED-certified architects, engineers, technology experts and an advisory board consisting of some of the world’s leading MCS doctors, researchers and environmental toxicologists. In partnership and certified by the international Institute for Bau-Biologie & Ecology (IBE), the housing system is the most transparent in the industry. It is the only housing product available to date that has been scientifically designed, tested, and vetted by environmental toxicologists and building materials experts.

The modular system offers numerous design options and sizes to suit personal preferences. They can be customized to be 100% self-sustaining, with off the grid technology, without compromising on comfort or aesthetics.

Trained general contractors are available to help assist with locations, permitting, site work, building and maintenance issues. A customer service help line is available seven days a week.

The factory manufactures with non-contaminating construction protocols, eliminating pollution and weather issues. Prior to delivery, each structure is tested for VOCs, energy efficiency, formaldehyde, mold, electromagnetic fields (EMF), communications frequency pollution reduction, as well as radiation. The most advanced air handling system heats and cools by fully exchanging the inside air every two hours at a minimum. The exterior is wrapped in an EMF barrier to protect from unwanted wavelengths. Custom wraps insure moisture contaminates do not enter the units while in transport or during the installation process. The wraps are fully reusable, eliminating any landfill needs.

The test units are available for an extended period of time, to insure individual compatibility, with long-term housing solution as the goal. The initial test units will be available in the second half of 2011 on the East Coast, with additional units scheduled reach the rest of the US in 2012.

Reservations accepted on a dire need basis and day rates determined by cost of land and utilities.
